819 Nice et al. 2013. A Hierarchical Perspective on the Diversity of Butterfly Species'

820 Responses to Weather in the Sierra Nevada Mountains

821 Appendix C. Supplementary Results: tabulation of standardized coefficients for species and year

822 effect, analyses of correlations among weather variables, and analyses of butterfly flight windows

823 and probabilities of occurrence.

Table C1: Species-level  $\beta$  coefficients for analyses with a single climate covariate and a year effect. Climate covariates are: winter minimum temperature, snow depth, and ENSO April-May. The columns for the  $\beta$  for year effect for a given analyses are indicated at the top of the column with the corresponding climate covariate in parentheses. Each species-level  $\beta$  is followed by the 95% credible interval in parentheses. Values of  $\beta$  whose 95% credible interval (95%CI) do not include zero are indicated in bold.

Table C2: Species-level  $\beta$  coefficients for analyses with a single climate covariate and a year effect, continued. Climate covariates are: spring maximum temperature, winter maximum temperature, and spring minimum temperature. The columns for the  $\beta$  for year effect for a given analyses are indicated at the top of the column with the corresponding climate covariate in parentheses. Each species-level  $\beta$  is followed by the 95% credible interval in parentheses. Values of  $\beta$  whose 95% credible interval (95%CI) do not include zero are indicated in bold.

Table C4: Results of analyses of year effect for unconstrained hierarchical model with species grouped according to natural history categories. For each natural history category, models were fit for each of the four weather variables and year. Standardized  $\beta$ 's and precision parameters ( $\tau$ 's) are reported for the year effect for each analysis. Samples sizes (n) are indicated for each natural history group. Values of  $\beta$  whose 95% credible interval (95%CI) does not include zero are indicated in bold. Standardized  $\beta$ 's and precision parameters ( $\tau$ 's) for the weather variables in each model are reported in Tables 4 and 5.

Table C5: Results of analyses of year effect for unconstrained hierarchical model with species grouped according to natural history categories, continued. For each natural history category, models were fit for each of the four weather variables and year. Standardized  $\beta$ 's and precision parameters ( $\tau$ 's) are reported for the year effect for each analysis. Sample sizes (n) are indicated for each natural history group. Values of  $\beta$  whose 95% credible interval (95%CI) does not include zero are indicated in bold. Standardized  $\beta$ 's and precision parameters ( $\tau$ 's) for the weather variables in each model are reported in Tables 4 and 5.

Climate Variable:	Spring max T	Winter max T	Spring min T

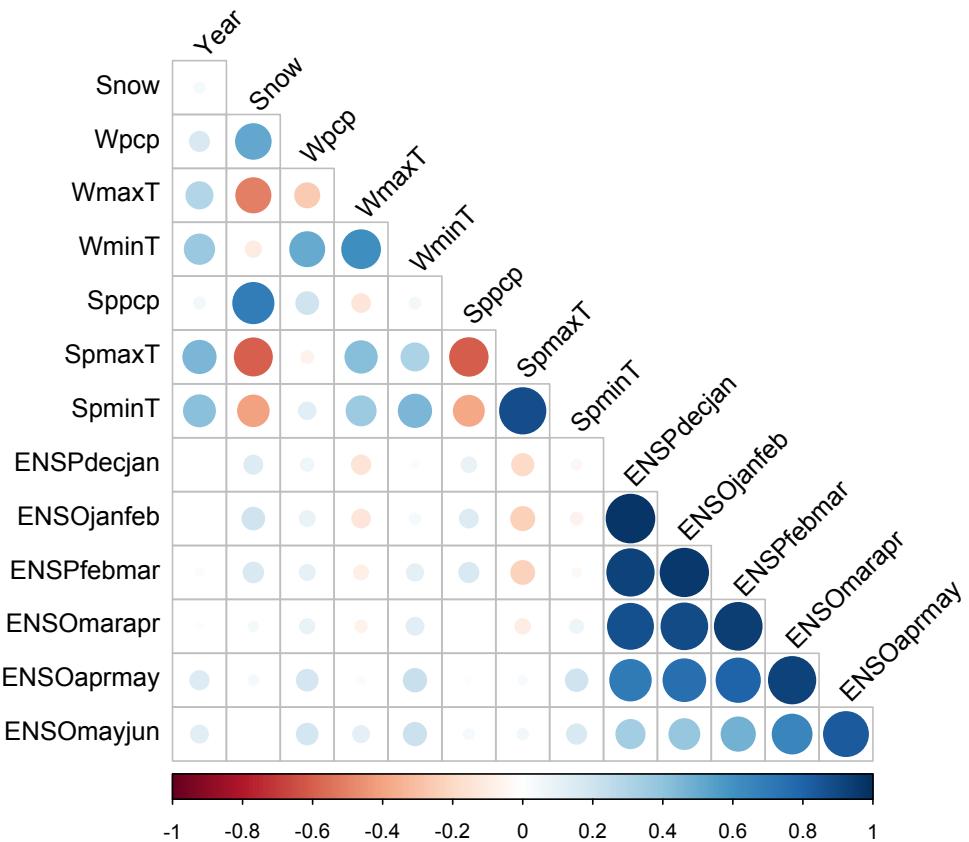

Figure C1: Matrix of correlations among weather variables and year. The colored scale at the bottom of the figure indicates the magnitude and sign of the correlations. The size of colored circles indicate significance level of the correlations: small circles indicate  $p < 0.05$ , medium circles indicate  $p < 0.01$ , large circles indicate  $p < 0.0001$ . Values are reported in Table C6.

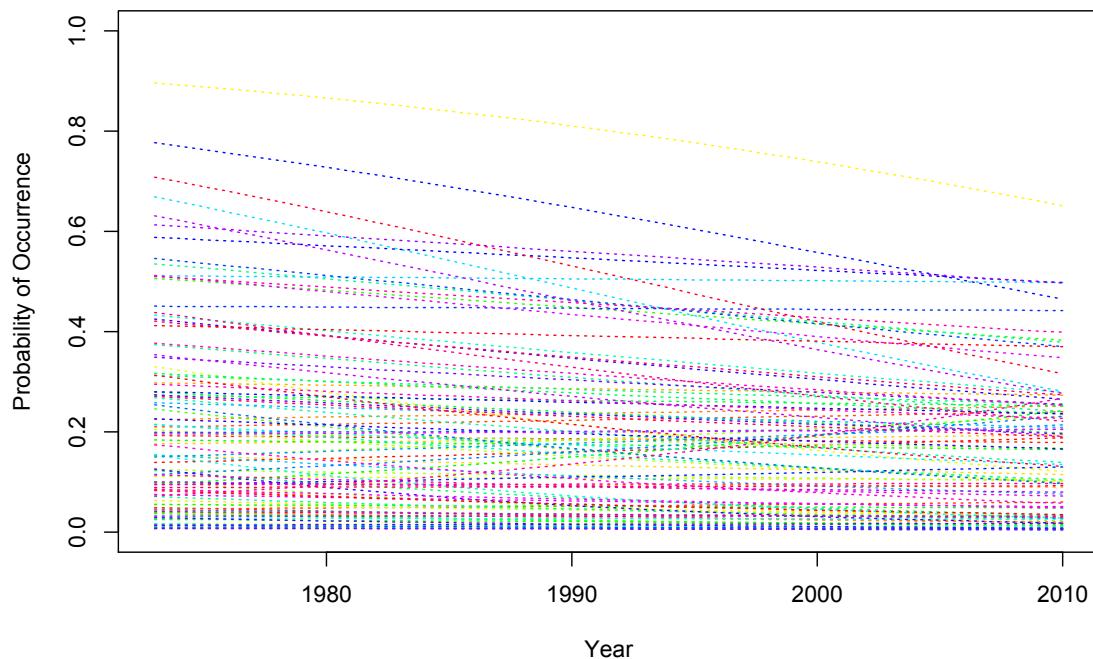

Figure C2: Estimates (medians of posterior distributions) of annual probability of occurrence ( $p$ ) for each of the 106 species included in analyses of the Donner Pass data from 1973 through 2010. Each species is represented by a different color line. 95% credible intervals have been omitted for clarity.

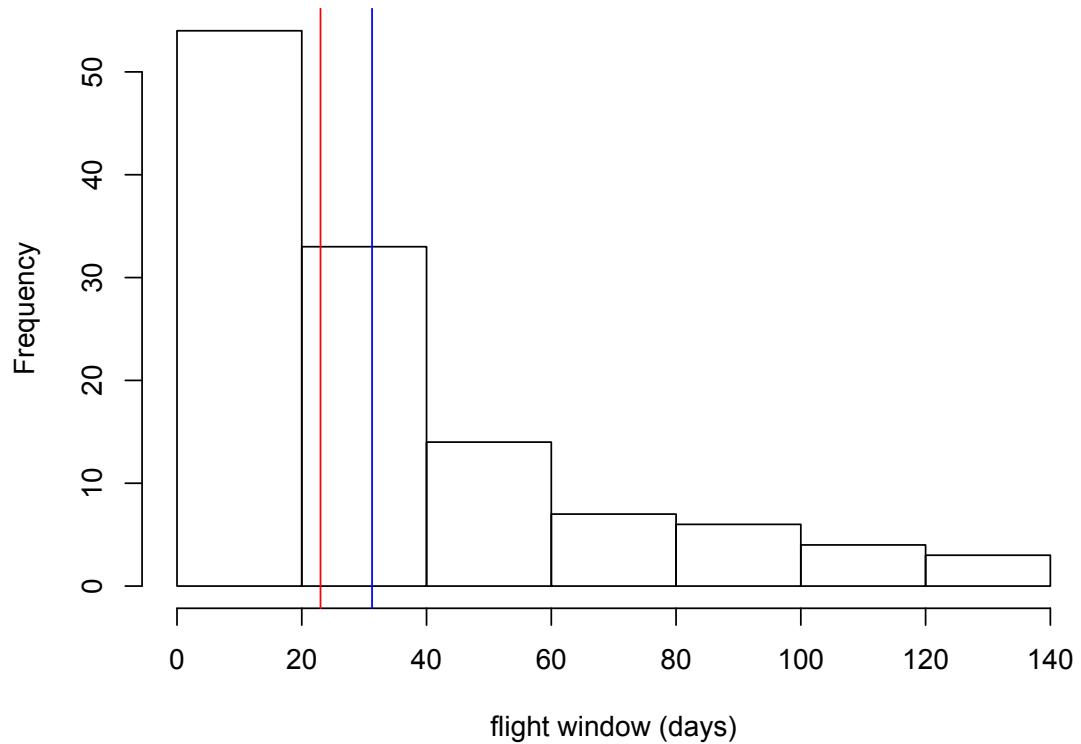

Figure C3: Distribution of the adult flight interval (flight window) for Donner Pass butterfly species. The number of days between date of first flight (i.e. when a species is first detected in a given year) and date of last flight for each species was averaged across the 38 years of data. The distribution of mean flight windows for the 106 species is plotted, the vertical red line indicates the median (23 days), the vertical blue line indicates the mean (31.3 days,  $\pm$  3.0 days, SE).

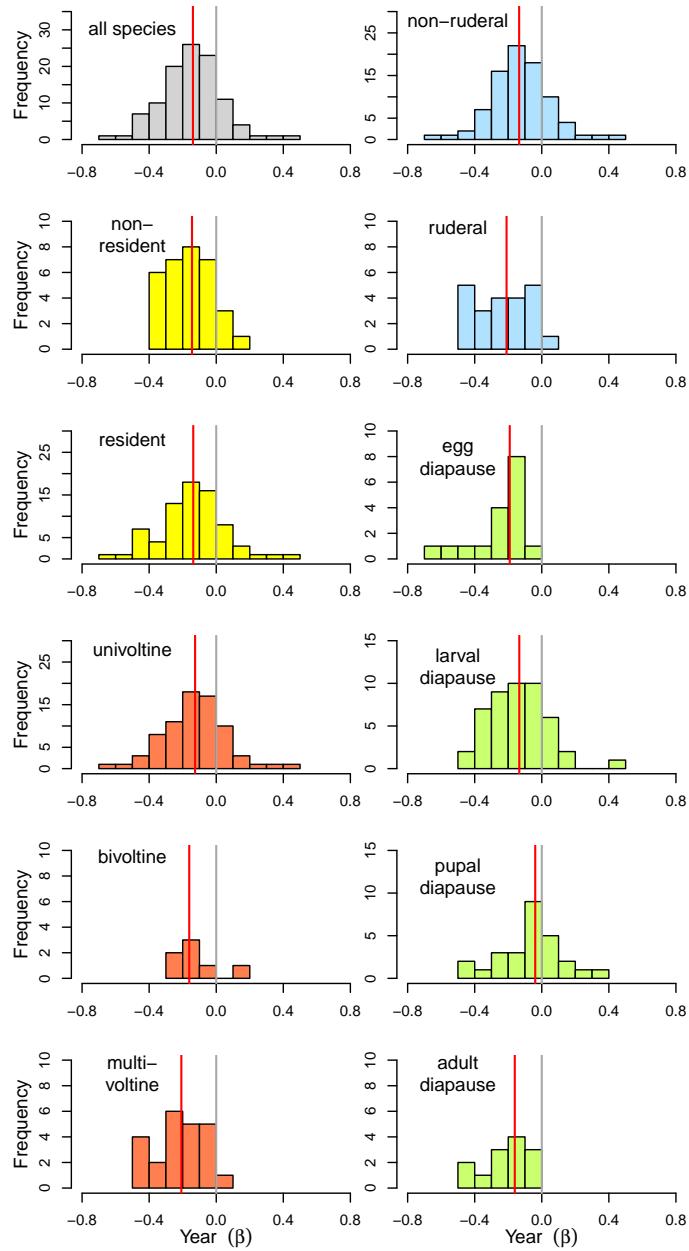

Figure C4: Histograms of standardized  $\beta$  coefficients for the year effect for all species (top left pane) and species grouped by natural history categories (separated by color for ease of visualization). Negative values of the year effect indicate a decline over years in the number of days that individual butterfly species were observed. For each panel, the vertical gray line indicates  $\beta = 0$  for reference, and the vertical red line indicates the median  $\beta$  for each group of species.
